for PC490HRD-11 excavators

K100 boom change system

K100 allows you to change your boom configuration on site, in just a few minutes, without leaving the cab and with no need for outside help.

A sophisticated Human Machine Interface (HMI) integrated in the machine's touch screen guides you when aligning the work equipment. All connections, mechanical, hydraulic and electrical are made automatically. You can remain safely in the cab at all times, and no personnel is required to handle heavy equipment at height.

K100 is 100% Komatsu designed, manufactured and supported.

A boost for your efficiency

With K100 you can make full use of the versatility built in to every Komatsu high reach demolition machine. The PC490HRD-11 can work with a range of attachments, from 2500 kg at 32 m maximum height up to 5000 kg from ground level to 17.4 m maximum height.

The K100 system allows you to easily switch between any of these configurations. In this way, you can configure the machine to suit the progress of the project, cutting down on project's time and potentially saving the costs of an additional machine.
